
Realizing SOA on the WebSphere DataPower Platform

andy.jones@soa.com
lisa.kirby@soa.com

SOA | software™
Powering the API Economy

Agenda

- SOA Software
- The Problem
- Planning and building SOA services
- Utilizing core DataPower functionality for SOA
- Implementing security
- Maintaining, managing and evolving the deployment
- The Future of SOA

About Us

- Privately held Enterprise Software company
- Established 1998
- More than 300 customers
- Gartner and Forrester leader in SOA & Application Services Governance
- Offices in London, LA, Chicago, New York, Paris, South Africa, Australia
- Offering software solutions for SOA Governance and API Management
- Plan, build, run and share
- Platform agnostic

Leader - Gartner Magic Quadrant 2013 Application Services Governance

Figure 1. Magic Quadrant for Application Services Governance

- Best Vision for:
API Management
SOA Governance
- Comprehensive and well
integrated offering
- Leading market understanding

Source: Gartner (August 2013)

The Gartner document is available upon request. *Gartner, Inc., Magic Quadrant for Application Services Governance by Paolo Malinverno, Daryl C. Plummer, Gordon Van Huizen, August 8th 2013.

The Problem

Applications architected according to service-oriented architecture (SOA) are becoming more common than ever. **Service-oriented applications increasingly include application functionality that is sourced from the cloud, private or public, according to different standards, but following the same architectural pattern.**

Gartner – Application Services Governances – August 2013

But why is that a Problem ?

All APIs and services go through several stages in their life cycles:

- Plan
- Design
- Implement/Build
- Operate/Run
- Maintain
- Retire

What ?

Right ?

Ready ?

Who ? Where ?

What Happens ?

Application Services Platform

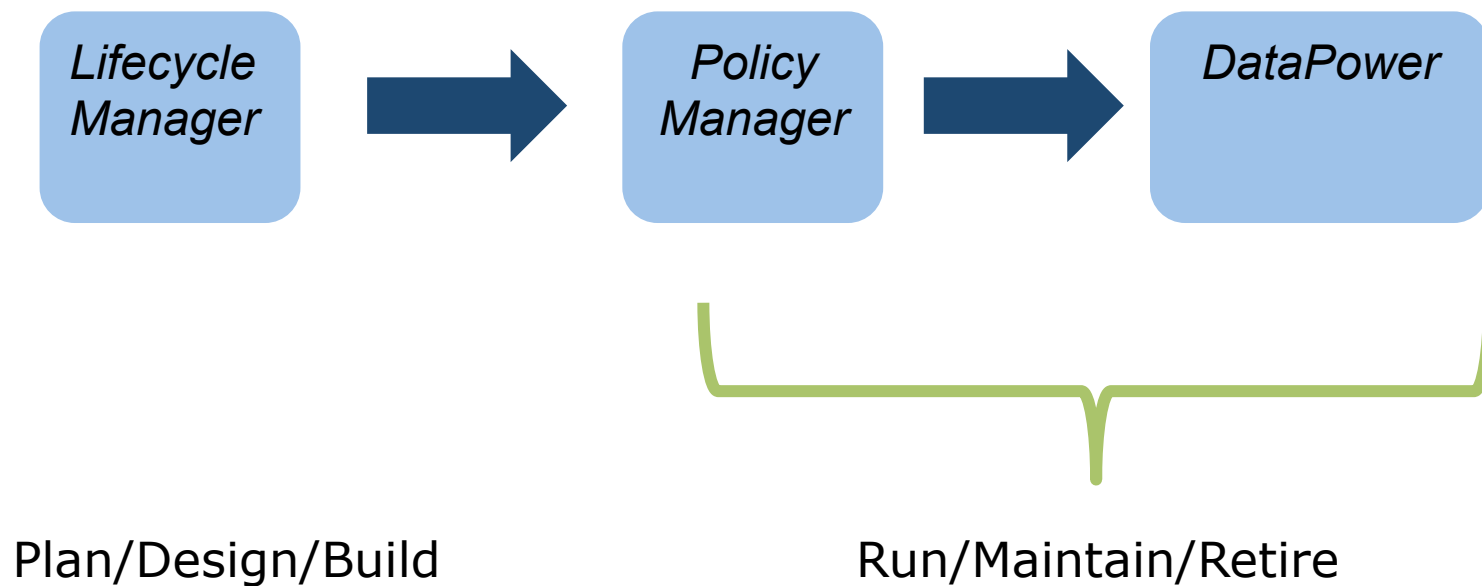

3 steps to Heaven

- Service Lifecycle Management
- Service Automation
- Service Administration and Monitoring

Key Components

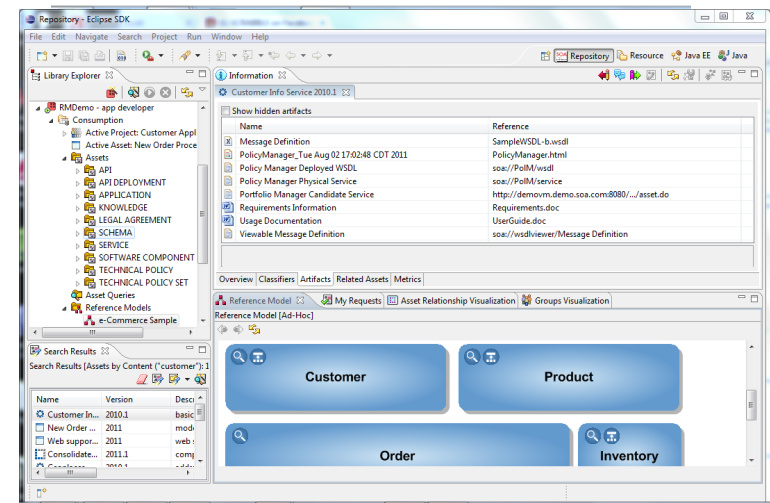

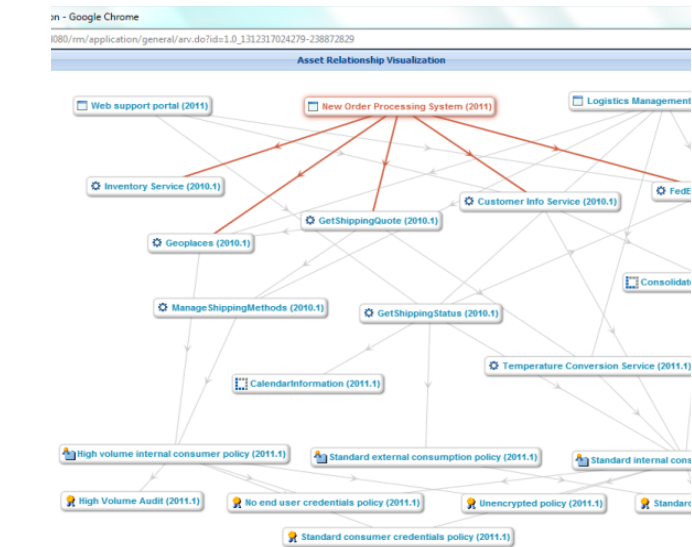

PLANNING

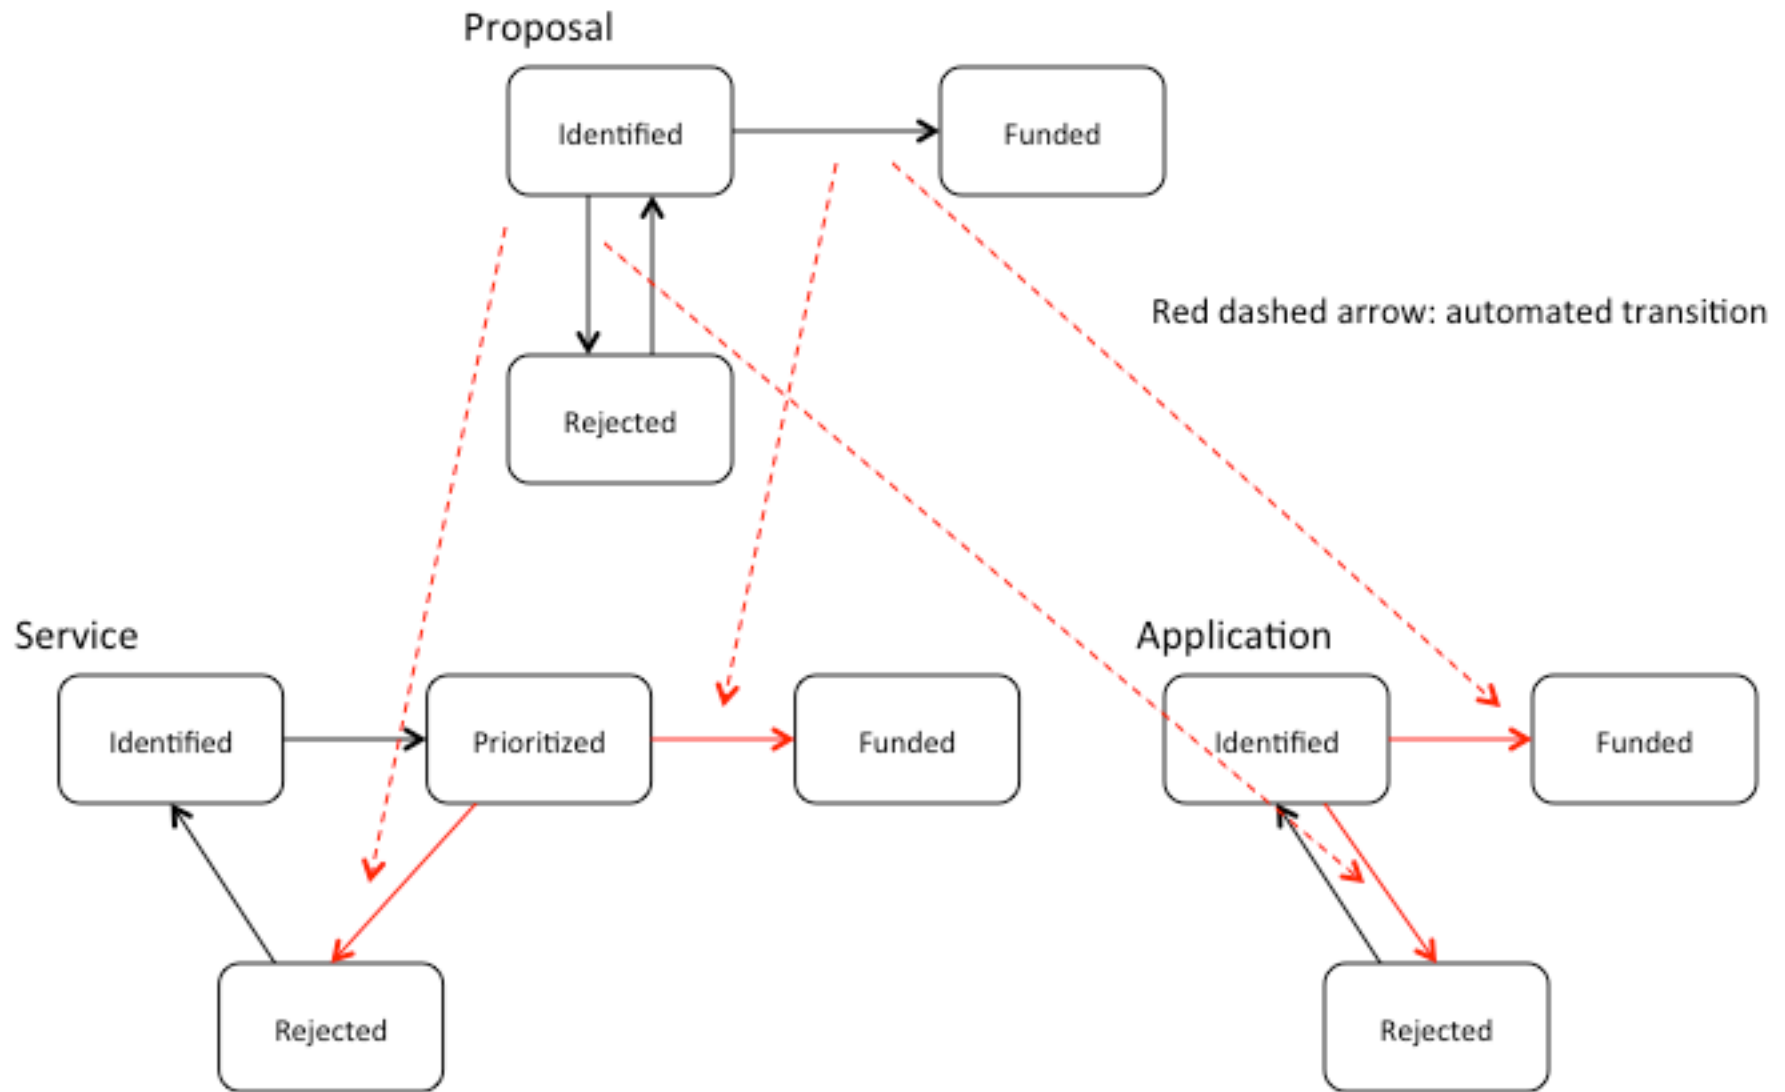

Lifecycle Manager

- Industry-leading SDLC governance platform
- Deep integration with IDEs, SCMs and other development tools
- Flexible development compliance policy modeling options including:
 - Phase-based content mandates
 - Automated compliance policy enforcement Auditable role-based review
- Rich impact analysis visualization across both internal and external consumers

Default Process

Lifecycle Management

- Lifecycle Manager creates a model of the SOA
 - Services
 - Schemas
- Policy Manager moves on to
 - Organisations
 - Containers
 - Services, Virtual Services
 - Policies
- Role based visibility
- Role based workflow
- Portfolio planning through to build and test
- Repository based

Lifecycle Manager delivers ...

- Define and design DataPower services in a collaborative environment
- Understand enterprise IT relationships
- Design standard, reusable DataPower policies

UTILIZING

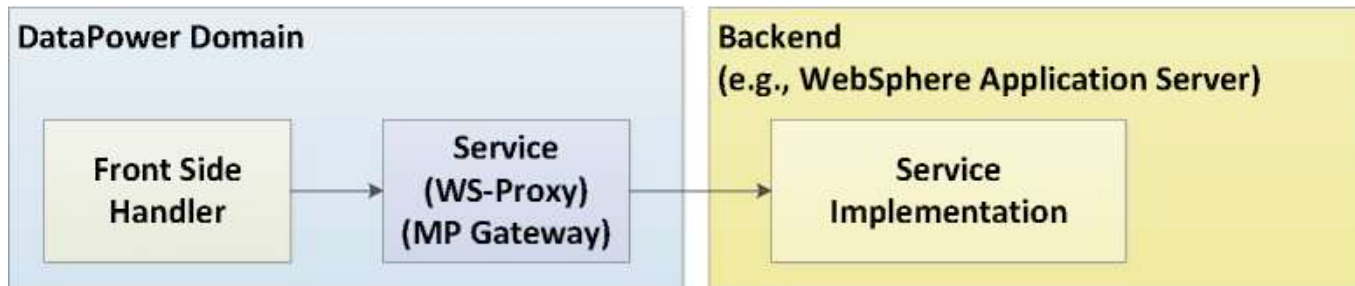

Creating and Deploying Services

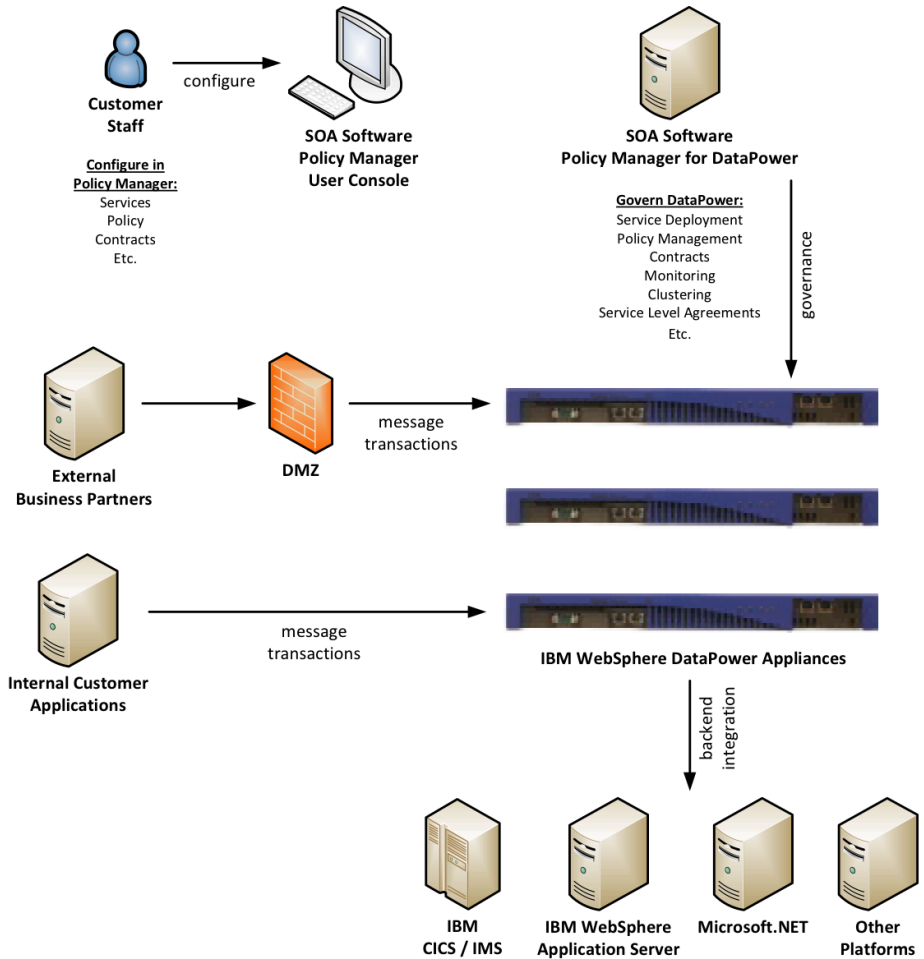

Policy Manager Service Model

DataPower Service Model

Target Architecture

Service Deployment

- Service types - Via WS-Proxy
 - SOAP 1.1
 - SOAP 1.2
 - Define virtual service in Policy Manager

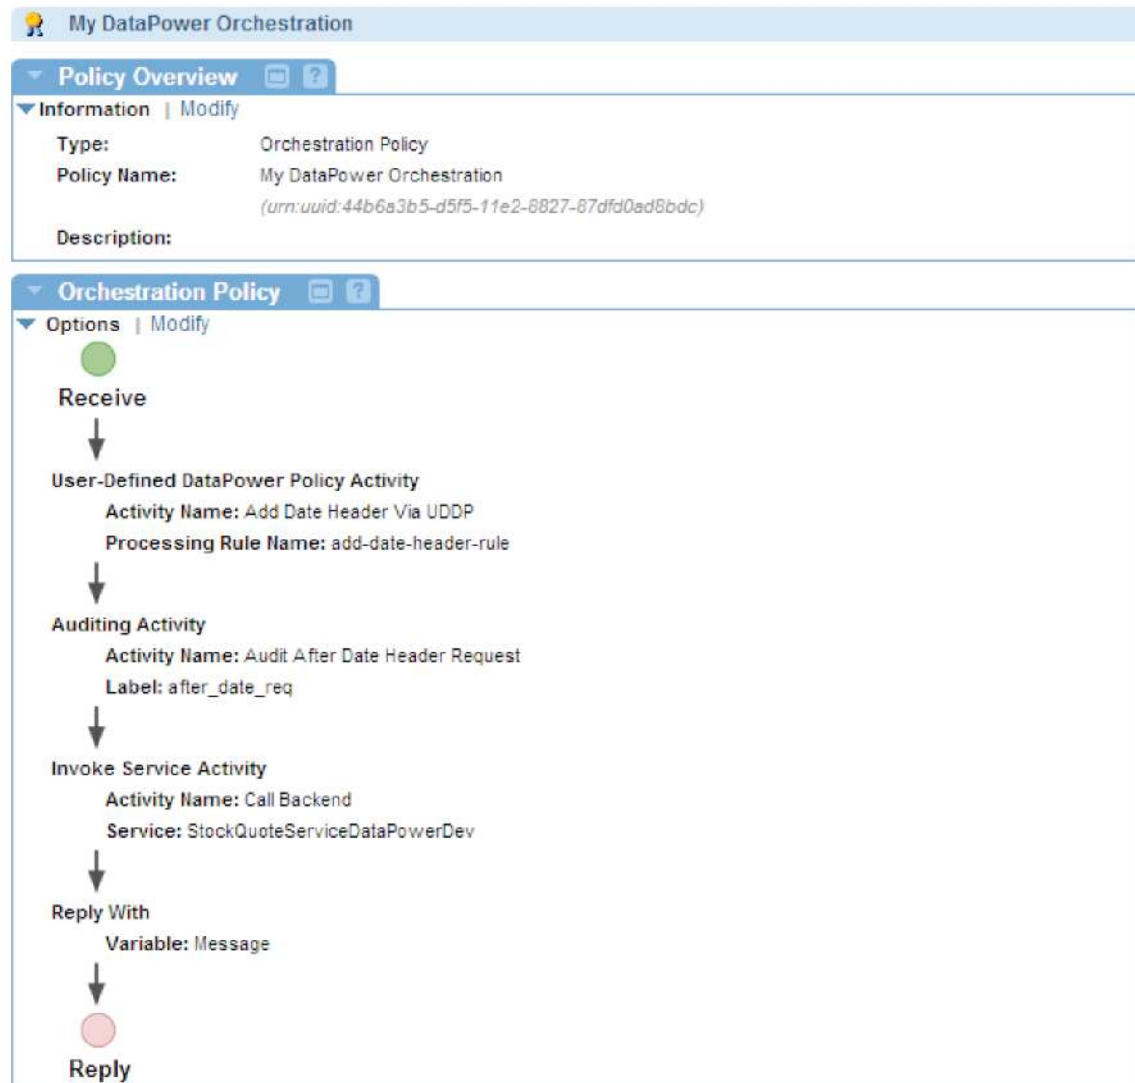

- Service types - Via MPG
 - REST
 - HTTP & HTTPS Transports
 - Define binding
 - Define operations

Securing DataPower Services

- Wide range of security schemes configurable from Policy Manager
 - WS-Security Policy
 - HTTP Security Policy
 - Contract authorization
 - Define security domains
- Example – Add Username Token for a SOAP Service
 - Define a *Transport Binding Policy*
 - Define a *Supporting Token Policy* choosing Username Token
 - Define an *Authentication Policy* – choose the security domain
 - Attach policies and deploy

 - Add contracts to authorize consumers

Orchestration

Customising DataPower Services

- User Defined Policies
- Include DataPower rules, detect malicious patterns

MAINTAINING, MANAGING ...

Monitoring DataPower Services - Alerts

- DataPower pushes logs to Policy Manager
- Two categories inside Policy Manager:
 - *container alerts*
 - *service alerts*
- Policy Manager stores alerts permanently for historical purposes or to aid in troubleshooting.
- Aggregate alerts across an entire DataPower infrastructure to make it easy for administrators to monitor a large DataPower estate.

Monitoring DataPower Services - Metrics

- DataPower pushes runtime for each service running in a domain.
- Policy Manager for DataPower stores them for manipulation.
- Metrics include
 - average response time,
 - maximum message size,
 - total faults (or errors) over a specific period of time.
- Three major uses:
 - *Real Time Charts* show current metrics for a running DataPower service
 - *Historical Charts* to see past performance.
 - *Service Level Policy* that uses metrics to look for specific patterns.

Monitoring DataPower - Auditing

- DataPower pushes message auditing details of selected services
- Stored as *Usage Logs* for view within Policy Manager.
- *Auditing Policies* within Policy Manager control which services should be audited, and to what extent.

Policy Manager delivers ...

- Model runtime aspects of services
- Configure through a few high level concepts
- Standardise and reuse policies and choices
- Collect monitoring data and metrics
- Monitor service level agreements and alert staff
- Business scaleable, efficient, low error

Analytics

Summary

- SOA Software provides
 - Lifecycle Management
 - Service Automation
 - Administration and Monitoring

- Good management and operational processes make SOA & API
 - Scalable
 - Cost effective

- Changes in IT Paradigms means that the SOA payoff is coming
